

Python and SQL Foundations

Technical foundations / programming portfolio artifact

Project Overview

This portfolio entry documents foundational Python and SQL work completed through Business Analytic Fundamentals coursework and self-directed programming practice. The artifacts show comfort with programming logic, data structures, relational querying, and clear code documentation.

What It Demonstrates

- Python fundamentals: variables, input/output, arithmetic, conditionals, loops, functions, lists, and basic statistics.
- SQL fundamentals: SELECT statements, filtering, sorting, grouping, aggregation, joins, and business-style summary queries.
- Reproducibility: organized code folders, public-facing README notes, and cleaned examples suitable for portfolio review.
- Communication: technical concepts explained for nontechnical reviewers and future analytics coursework.

Public Portfolio Note

These artifacts are intended to show technical foundations rather than advanced software engineering. Several Python scripts are intentionally interactive because they were created for introductory programming assignments. SQL examples are cleaned public examples based on sample database practice and do not include private data.

Artifact	Purpose
Code portfolio PDF	Summarizes the learning objectives, sample code patterns, and portfolio relevance.
Code folders	Show Python and SQL examples in an organized public structure.
Certificates	Provide supporting evidence of Python and SQL foundation work.
Selected visuals	Translate technical concepts into quick-review portfolio graphics.
